DESIGN RATIONALE

From waste collection to value recovery: why each photograph was chosen

The carousel follows the material along its journey in four different realistic scenes: packaging leaking out of the system, a return handover, how well it is collected and handled, and what processing turns it into. Each photograph was generated for that slide's exact message and checked by eye before use.

The road on slides 1+2 (top row) and 3+4 (bottom row), side by side as they sit in the carousel: the road never breaks at the slide edge.

How to read the visuals

- One shared look: documentary editorial photography, soft natural daylight, 35mm eye-level perspective, shallow depth of field, Indian urban, retail and industrial settings, plain unbranded packaging, nothing legible in the image.
- A light, consistent colour grade was applied to all four so they read as one series (slightly muted, true greens). Slide 2 was cooled and slide 3's strongly saturated crates were toned down.
- Four different compositions, so no two slides repeat a layout or subject: full-bleed street scene on top (1), portrait handover (2), wide sorting table (3), close-up macro (4).
- All text sits on white outside the photographs, so nothing competes with the images.

Honest weak spots

- Slide 2 is a generic, plain return handover. It deliberately avoids a branded kiosk or machine, so it does not imply one specific scheme design; the cost is that it can read as an ordinary shop counter without the headline.
- Photographs are AI-generated. They were checked for warped hands, objects and unreadable gibberish, but a final human look before publishing is sensible, especially at full size on slide 2 (hands) and slide 3 (wrappers).
- The images illustrate stages; they do not show that any particular packaging is recycled. Collection (2), sorting and handling (3) and processing (4) are kept visually separate on purpose.

SLIDE 1 OF 4

Slide 1 – Value is at risk after consumption

What it communicates

Packaging can retain value, but littering, improper disposal and gaps in collection stop it reaching recovery channels. The fix is a more organised collection system and a clear pathway to material recovery.

What the picture shows

- A low, kerb-level view of an ordinary city street early in the morning: a handful of empty bottles and cans resting against the kerb beside a storm drain grating.
- The street recedes into soft focus with passers-by and parked scooters: this is everyday leakage, not a dump.
- The litter sits lower-left; the logo plate and heading sit on white around it.

Details and accuracy checks

Littering	Packaging lying loose at the kerb, outside any system.
Improper disposal	Items next to a drain instead of in a collection stream.
Gaps in collection	An ordinary street with no collection point in sight.
Kept modest	A few items only. No heaps, smoke or landfill drama.

SLIDE 2 OF 4

Slide 2 – A Deposit Refund Scheme creates a structured return pathway

recykal
Sustainable Circularity

A DEPOSIT REFUND SCHEME CREATES A STRUCTURED RETURN PATHWAY.

A Deposit Refund Scheme (DRS) uses a **nominal refundable deposit** to encourage the return of DRS-eligible empty packaging.

This helps channel packaging into **organised collection systems**, where it can move towards recycling.

www.recykal.com

What it communicates

A DRS uses a nominal refundable deposit to encourage the return of eligible empty packaging, channelling it into organised collection systems where it can move towards recycling.

What the picture shows

- A customer hands empty bottles across a plain counter to an attendant: the act of returning.
- Behind the counter, stacked crates of collected empties: organised collection rather than loose packaging.
- The warm shop interior contrasts with the cooler street of slide 1: from loose to handed in.

Details and accuracy checks

Hands in the foreground	The return is a deliberate, repeatable action.
Crates of empties	Collected packaging held in an organised way.
No machine, no signage	Keeps the scene generic and avoids implying one scheme design.
Deposit	Carried by the copy; the image only shows the return handover.

SLIDE 3 OF 4

Slide 3 – Collection quality decides how much value is recovered

recykal
Sustainable Circularity

MATERIAL QUALITY MATTERS FOR RECOVERY.

How packaging is collected and handled affects its **suitability for recycling.**

Contamination and poor handling can reduce **material quality** and limit the value that can ultimately be recovered.

www.recykal.com

What it communicates

How packaging is collected and handled affects its suitability for recycling. Contamination and poor handling reduce material quality and limit the value that can ultimately be recovered.

What the picture shows

- Gloved hands sort bottles at a table between two crates, seen from the front and slightly above.
- Left crate: clean, empty, dry bottles. Right crate: bottles with visible residue and food-soiled wrappers.
- Same table, same worker: the only difference is how the material was collected and handled.

Details and accuracy checks

Clean crate (left)	Material that stays suitable for recycling.
Soiled crate (right)	Contamination and poor handling that reduce quality.
Worker's hands	Handling and sorting: the human step that shapes quality.
Modest contrast	Obvious at a glance but not exaggerated.

SLIDE 4 OF 4

Slide 4 – Every stage keeps material value in circulation

recykal
Sustainable Circularity

BUILDING A BETTER PATHWAY MEANS KEEPING MATERIAL VALUE IN CIRCULATION.

DRS helps strengthen the **return and collection** of eligible packaging. Effective sorting, processing and recycling help turn collected material into a **usable resource.**

The goal: help packaging's material value **find its way back into the economy.**

www.recykal.com

What it communicates

A better pathway keeps material value in circulation. DRS strengthens the return and collection of eligible packaging; sorting, processing and recycling turn it into a usable resource. The goal is for the value to find its way back into the economy.

What the picture shows

- A gloved hand holds a scoop of clean shredded PET flakes inside a recycling plant, flakes falling into a bin below.
- The washing and processing line stands soft in the background: this is processing, clearly after collection and sorting.
- The flakes are the 'usable resource' of the copy: material that has kept its value.

Details and accuracy checks

Clean PET flakes	Recovered material, shown as a usable resource.
Plant in the background	Processing and recycling, distinct from collection (slides 2 and 3).
Falling flakes	Material moving on to its next use.
No claim of completeness	Shows a processing stage, not that every collected item is recycled.
